RESEARCH SIGNALS

How mbioTraders detects BUY and SELL

An illustrated guide to the actual multi-timeframe and 5-minute entry logic, including stop-loss placement, 2R targets, and browser alerts.

KEY PRINCIPLE

Five higher timeframes agree. The 5-minute chart confirms the entry. Missing real prices mean WAIT, never a guessed signal.

7	5	2	1:2
Markets	Trend frames	Strong candles	Risk / reward

MARKET DATA FIRST

The app verifies real candle histories, five higher-timeframe votes, and the exact third-candle opening before any signal. Stale, missing, or incomplete data means WAIT.

All charts in this guide are illustrative. No brokerage orders are placed. A detected setup is research information, not a guaranteed outcome.

01 / THE DECISION PATH

A signal passes several gates

The engine stops at WAIT whenever a technical prerequisite is missing. Each step must be verified before a signal can activate.

01 **Real market feed**

All 5m, 15m, 30m, 1H, 4H and 1D candle histories must be available, complete and current.

02 **Five-timeframe consensus**

15m, 30m, 1H, 4H and 1D all indicate the same direction. The 5m is excluded from trend voting.

03 **5m countertrend pullback**

At least one opposite-direction candle exists in the six candles immediately before the two confirmations.

04 **Two strong completed candles**

Both consecutive 5m candles close with the chosen direction and each has a body at least 60% of range.

05 **Actual third-candle opening**

The next 5m opening quote exists and arrives within 90 seconds of the opening boundary.

06 **Earlier confirmed pivot, valid risk**

BUY: stop at earlier 5m swing low. SELL: swing high. Target is exactly twice the entry-to-stop distance.

07 **Activate and track**

A new signal is saved once per pair and remains active until real 5m candles verify TP or SL.

Each check uses completed, verified market candles. Missing evidence never becomes a fabricated signal.

02 / THE CONFIRMATION RULE

A strong candle needs 60% body

Strong means directional conviction in a closed 5-minute candle - not merely a green or red close.

Candle body / full range **65% (minimum 60%)**

Candle body / full range **35% (minimum 60%)**

FORMULA

Body fraction = abs(Close - Open) / (High - Low)

The ratio must be 0.60 or greater. A BUY candle must close above its open; a SELL candle must close below its open. Both confirmations must be completed and consecutive.

EXACT TIMING

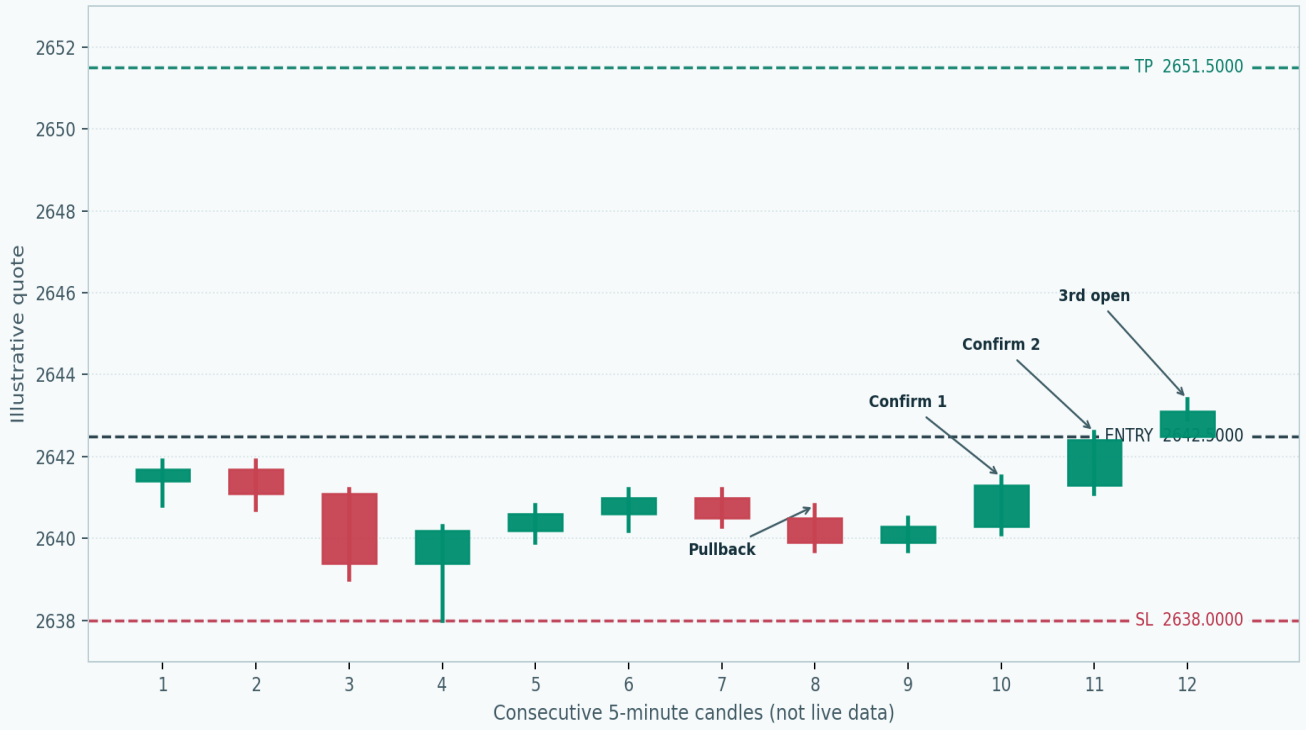

After the two closed confirmations, the system waits for the real opening price of the third 5-minute candle. Entries arriving early, more than 90 seconds late, or without a verified opening price are rejected.

A high confidence score by itself does not bypass a missing timeframe, weak candle, stale feed, or invalid pivot.

03 / EXAMPLE

BUY: pullback then confirmation

Illustrative price levels: the larger trend is aligned, then the 5-minute chart prints two bullish 5m confirmations.

ENTRY	STOP LOSS	TAKE PROFIT
2642.5000	2638.0000	2651.5000

RULES VERIFIED

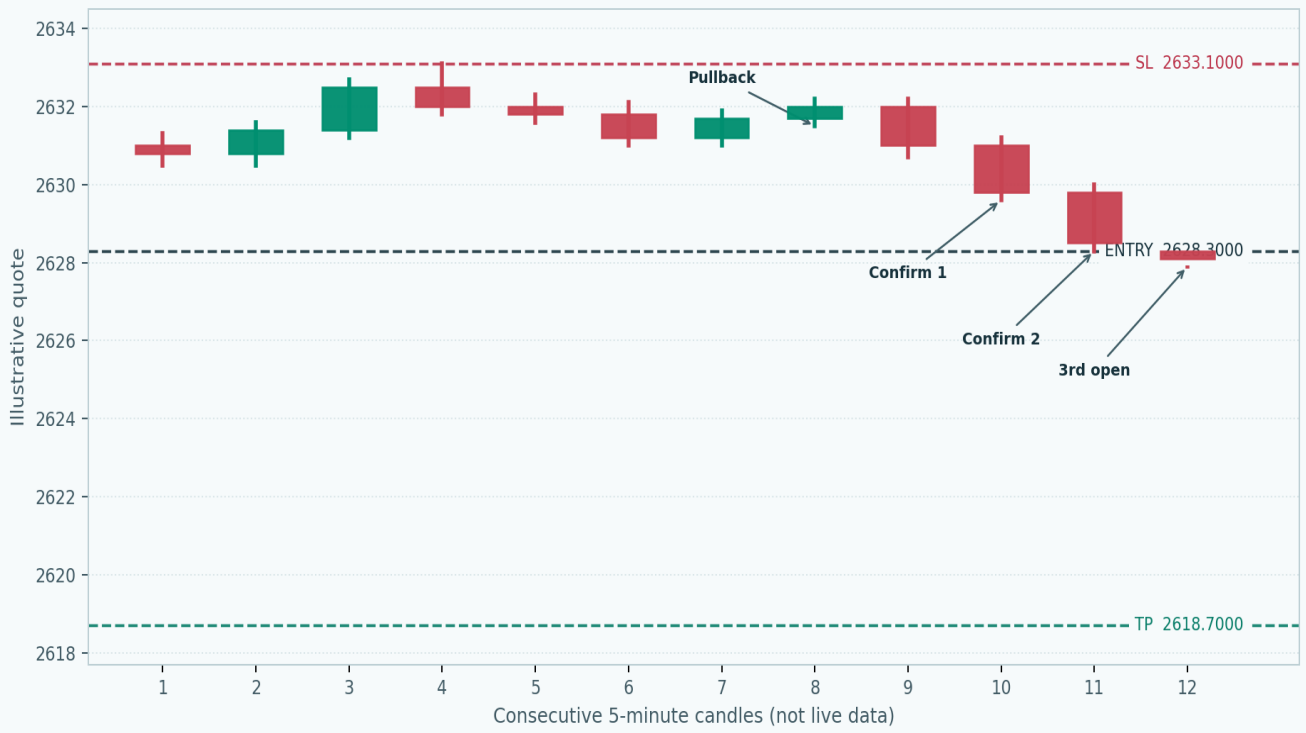

An earlier confirmed 5-minute pivot is used for the stop, not the latest confirmation candle. The third candle must have a true opening price. The target equals 2 times the risk.

Illustration only. The target line is a projected level, not a claim that a trade reached it.

04 / EXAMPLE

SELL: pullback then confirmation

Illustrative price levels: the larger trend is aligned, then the 5-minute chart prints two bearish 5m confirmations.

ENTRY	STOP LOSS	TAKE PROFIT
2628.3000	2633.1000	2618.7000

RULES VERIFIED

An earlier confirmed 5-minute pivot is used for the stop, not the latest confirmation candle. The third candle must have a true opening price. The target equals 2 times the risk.

Illustration only. The target line is a projected level, not a claim that a trade reached it.

05 / SIGNAL LIFECYCLE

What happens after activation?

The dashboard is a signal and research tool. It does not place real orders for users.

01 Signal becomes active

Store the pair, entry, pivot stop, 2R target, direction and activation time in the local browser ledger.

02 Browser notification

If Alerts is enabled and permission has been granted, send an actual browser/OS notification with the prices. This requires the page/app to be running.

03 Track verified outcome

Wait for actual 5-minute OHLC candles to cross TP or SL. If both are crossed in one candle, resolve conservatively as SL.

04 Store history

Keep at most 100 settled results across markets. Show two rows per page and support CSV export.

05 Connection safety

Missing candles, stale quotes or unavailable public market feeds keep the dashboard in WAIT/retry. Never fake market data.

PROTECT YOUR CAPITAL

Market volatility, gaps and spreads can affect real fills. Size risk carefully and treat alerts as research, not orders.

06 / ENGINEERING CHECKLIST

The rules, in one reference

These limits are intended to be checked against real candle data before interpreting any displayed BUY or SELL.

Public market feeds	Gold and 5 forex: Deriv; BTCUSD: Kraken
Trend vote	15m, 30m, 1H, 4H, 1D must agree
5m pullback	At least 1 countertrend candle in the preceding 6
Confirmation	2 consecutive completed directional candles, body >= 60%
Entry	Real third 5m open, no later than 90 seconds
Swing / stop	Earlier confirmed five-candle pivot; risk must be positive
Take profit	Entry +/- 2 x abs(Entry - Stop)
Data integrity	All six timeframe histories must be real and complete
Active tracking	Persistence, verified exit, at most 100 history results
Notifications	Permission required, only while app/page runs

This guide is intended for understanding the system. Always account for spreads, gaps, fees, liquidity and rapid volatility. No signal promises a profit.
